

ABSTRACT

[00100] The present invention relates to novel mixed release pharmaceutical formulations having one or more active ingredients, wherein the release profile of the active ingredients is controlled to maximize effectiveness of the pharmacological action

5 of the actives. A capsule for use with the present invention may include a first active available for immediate release and a second active for extended release selected from a decongestant, an antihistamine, an expectorant and/or an antitussive that when administered orally provide for the symptomatic relief of cough associated with respiratory tract conditions such as the common cold, bronchial asthma, acute and

10 chronic bronchitis.
